A CRM Application for the Chai Shop

1. Salesforce Developer Account Creation

Activity 1: Creating Developer Account

A Salesforce Developer Account is created to develop and configure the CRM application. The user registers with the required personal details, email address, username, and password. After registration, the Salesforce Developer environment is available for application development.

Activity 2: Account Activation

After registration, an activation email is sent to the registered email address. The user opens the verification link and activates the Salesforce account. After activation, the user can log in and access the Salesforce Developer environment.

2. Objects

Activity 1: Employer Account Object

The Employer Account Object is created to store and manage employer information. It contains important details such as employer name, contact information, business details, and related order information.

Activity 2: Customer Account Object

The Customer Account Object is created to maintain customer information. It stores details such as customer name, contact number, email, address, and order-related information.

Activity 3: Enterprise Account Object

The Enterprise Account Object is created to manage enterprise-level customers. It stores enterprise name, business details, contact information, sales information, and other required details.

3. Tabs

Activity 1: Custom Tabs Creation

Custom tabs are created for the required objects in Salesforce. These tabs allow users to easily access, create, view, edit, and manage Employer, Customer, and Enterprise records from the Salesforce navigation menu.

4. Record Types

Activity 1: Online Orders Record Type

The Online Orders Record Type is created to manage orders received through online channels. It helps users identify and manage online orders separately.

Activity 2: Walk-In Orders Record Type

The Walk-In Orders Record Type is created to manage orders placed directly at the Chai Shop. It helps distinguish walk-in orders from online orders.

5. Validation Rules

Activity 1: On Employer Account

Validation rules are created on the Employer Account to ensure that required information is entered correctly. It prevents incorrect or incomplete data from being saved.

Activity 2: On Customer Account

Validation rules are applied to the Customer Account to maintain accurate customer information. It checks required fields and prevents invalid data entry.

Activity 3: On Enterprise Account

Validation rules are created on the Enterprise Account to maintain correct enterprise information. It ensures that important business conditions are satisfied before saving a record.

6. Fields & Relationships

Activity 1: Create Custom Fields for Employer Account

Custom fields are created to store additional employer information. These fields can include contact details, business details, order information, and other required data.

Activity 2: Create Custom Fields for Customer Account

Custom fields are created for storing customer-specific information such as phone number, email, address, customer type, and order details.

Activity 3: Create Custom Fields for Enterprise Account

Custom fields are created to store enterprise information such as company details, contact information, sales details, and other business-related data.

7. Global Picklist

Activity 1: Create Global Picklist

A Global Picklist is created to provide predefined values that can be reused in different fields. It helps maintain consistency and reduces errors during data entry.

8. Reports & Dashboards

Activity 1: Customer Account Sales Report

A Customer Account Sales Report is created to display customer sales and order information. It helps users monitor customer-related sales activities.

Activity 2: Enterprise Account Sales Report

An Enterprise Account Sales Report is created to display enterprise sales information. It helps users analyze enterprise account sales and related activities.

Activity 3: Dashboard

A Dashboard is created to display important CRM information visually. It can contain charts, tables, and summary components based on customer and enterprise sales reports.

9. Email Template

Activity 1: Email Template

An Email Template is created to provide standard messages for CRM communication. It contains a subject and message body and can use record information through merge fields.

Activity 2: Email Alert

An Email Alert is configured to automatically send email notifications when a specified Salesforce condition or automation is triggered. It helps users receive important updates on time.

10. The Lightning App

Activity 1: Create a Lightning App

A Lightning App is created for the Chai Shop CRM. It provides a single workspace to access the required objects, custom tabs, reports, dashboards, and other Salesforce features. The application makes CRM activities easier to manage and provides a user-friendly interface.

11. Conclusion

The Chai Shop CRM Application is developed using Salesforce to manage Employer, Customer, and Enterprise accounts efficiently. The application includes custom objects, tabs, record types, validation rules, custom fields, global picklists, reports, dashboards,

email templates, and a Lightning App. These features help organize business data, improve data accuracy, monitor sales, and simplify CRM management.
